Surface Area of Pyramids

regular pyramid: base is a regular polygon; segment connecting vertex to center of base is \perp to base

slant height: height of each
lateral face (l)

Lateral Area: $\frac{1}{2}Pl$

P : perimeter of base

l : slant height

ex: regular hexagonal pyramid

sides of base: 4 in, slant height:
12 in

$$LA = \frac{1}{2} P l$$

$$LA = \frac{1}{2} 24 \cdot 12$$

$$LA = 144 \text{ in}^2$$

Surface Area: $\frac{1}{2}Pl + B$

B: area of base

ex: reg. square pyramid, sides of base 18m, altitude is 24m, find SA.

$$\frac{1}{2}Pl + B$$

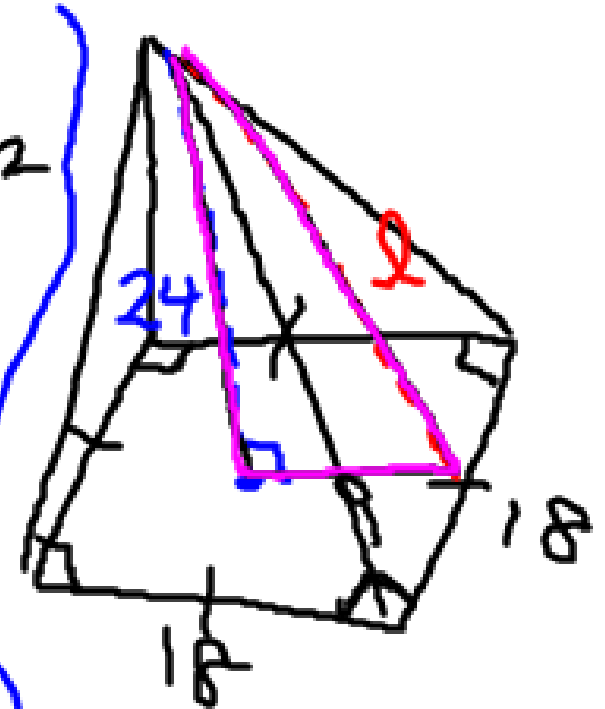

$$\frac{1}{2}72 \cdot \sqrt{657} + 324$$

$$1246.8 \text{ m}^2$$

$$24^2 + 9^2 = l^2$$

$$\sqrt{657} = \sqrt{l^2}$$

$$\sqrt{657} = l$$
